Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/611,437

Applicant(s)

VOELLM ET AL.

Examiner

SAIF A. ALHIJA

Art Unit

2128

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 25 August 2008.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-24 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-24 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 30 June 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/5508)
- Paper No(s)/Mail Date _____

- 4) ☐ Interview Summary (PTO-413)
- Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

1. Claims 1-24 have been presented for examination.

Response to Arguments

2. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 25 August 2008 has been entered.

NON-PRIOR ART ARGUMENTS

i) Applicants argue the 101 rejections of the claims. As per *Gottschalk v. Benson*, 409 U.S. 63, 71-72, 175 USPQ 673, 676 (1972) the claims must result in a physical transformation or provide a "particular machine" for execution. The claims do not meet either of these criteria since they provide no physical transformation and the claimed process is performed on a general purpose computer rather than a "particular machine." Therefore the 101 rejections of the claims are maintained. It is further noted that Applicants did not respond to the rejection in view of paragraph 18 of the specification of the instant application. The rejection is reproduced below.

- ii) Following Applicants amendments a 112 2nd rejection has been provided below.

PRIOR ART ARGUMENTS

iii) Applicants argue that the combination of references do not teach the negotiation of transactions available limit between a client and server or the information stored on the client that is sent to the server to use in determining the balance of resources. Further Applicants argue that the reference does not teach that the server rebalances resources based on information received from the client. The Examiner notes that in view of **KSR, 550 U.S. at ___, 82 USPQ2d at 1391** which reads **"The Supreme Court further stated that: When a work is available in one field of endeavor, design incentives and other market forces can prompt variations of it, either in the same field or a different one. If a person of ordinary skill can implement a predictable variation, § 103 likely bars its patentability. For the same reason, if a technique has been used to improve one device, and a person of ordinary skill in the art would recognize that it would improve similar devices in the same way, using the technique is obvious unless its actual application is beyond his or her skill. Id. at ___, 82 USPQ2d at 1396."** (Emphasis added) The Examiner cannot see how a person of ordinary skill in the art would

Art Unit: 2128

lack the skill to combine the references nor can the Examiner see how the use of client side balancing in combination with load balancing would be unpredictable. The Examiner notes that as an example **Ballard in Column 2, Lines 59-62** states “According to another aspect of the invention, an additional method for load balancing is achieved by specifying a maximum frequency of requests (e.g., xx requests/minute) at which a server can be accessed.” The recitation of a maximum frequency of requests reads on the amended limitations regarding the transaction limit and its negotiation. As stated by Applicants the claimed invention intends to have the server rebalance the resources based on information received from the client. This is seen in the client side load balancing, Element 54 of Figure 6 of Ballard, in view of Column 3, Lines 14-20 of Forecast which recites imbalance conditions detected as well as the allocation and de-allocation as a result. The Examiner notes that Applicants are arguing rudimentary and elementary features of load balancing in a client server environment which are clearly shown in the combination of Forecast and Ballard. In fact Applicants argue in their remarks dated 17 December 2007 that Forecast does not recite client side load balancing information for which the Examiner provided Ballard in support. Applicants then argue in their remarks dated 25 August 2008, top of page 12, that client side balancing is different than the claimed invention. The Examiner is puzzled by these apparently contradictory statements. Forecast recites load balancing in a client server environment where the information for balancing is server side and Ballard teaches that load balancing is performed client side. The recitation of the server throttling the client with respect to transaction limit is by definition load balancing as recited in the Forecast and Ballard references. As such in view of the obviousness rejection and the criteria of KSR cited above the rejection is maintained.

EXAMINERS NOTES

iv) The Examiner has cited particular columns and line numbers in the references applied to the claims for the convenience of the applicant. Although the specified citations are representative of the teachings of the art and are applied to specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in their entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the Examiner.

Art Unit: 2128

v) The Examiner respectfully requests, in the event the Applicants choose to amend or add new claims, that such claims and their limitations be directly mapped to the specification, which provides support for the subject matter. This will assist in expediting compact prosecution.

vi) Further, the Examiner respectfully encourages Applicants to direct the specificity of their response with regards to this office action to the broadest reasonable interpretation of the claims as presented. This will avoid issues that would delay prosecution such as limitations not explicitly presented in the claims, intended use statements that carry no patentable weight, mere allegations of patentability, and novelty that is not clearly expressed.

vii) The Examiner also respectfully requests Applicants, in the event they choose to amend, to supply a clean version of the presented claims in addition to the marked-up copy in order to avoid potential inaccuracies with the version of the claims that would be examined.

Claim Rejections - 35 USC § 101

35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

MPEP 2106 recites:

The claimed invention as a whole must accomplish a practical application. That is, it must produce a "useful, concrete and tangible result" State Street 149 F.3d at 1373, 47 USPQ2d at 1601-02. A process that consists solely of the manipulation of an abstract idea is not concrete or tangibles. See *In re Warmerdam*, 33 F.3d 1354, 1360, 31 USPQ2d 1754, 1759 (Fed.Cir. 1994). See also *Schrader*, 22 F.3d at 295, 30 USPQ2d at 1459.

3. Claims 1-24 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

i) Claims 1, 13, 18, and 19 recite a computer readable medium having components. The claims merely discuss configuring, computing, as well as a plurality of data fields. As such the claims do not produce a useful, concrete, and tangible result. Applicant's amendments reciting utilizing the server to rebalance the resources does not overcome the lack of a tangible result in the claims. As per *Gottschalk v. Benson*, 409 U.S. 63, 71-72, 175

Art Unit: 2128

USPQ 673, 676 (1972) the claims must result in a physical transformation or provide a "particular machine" for execution. The claims do not meet either of these criteria since they provide no physical transformation and the claimed process is performed on a general purpose computer rather than a "particular machine."

- ii) The specification of the instant application in paragraph 18 states

¹⁶
[0018] Computing device 100 may also contain communication connections 116 that allow the device to communicate with other computing devices 118, such as over a network. Communication connections 116 is one example of communication media. Communication media may typically be embodied by computer readable instructions, data structures, program modules, or other data in a modulated data signal, such as a carrier wave or other transport mechanism, and includes any information delivery media. The term "modulated data signal" means a signal that has one or more of its characteristics set or changed in such a manner as to encode information in the signal. By way of example, and not limitation, communication media includes wired media such as a wired network or direct-wired connection, and wireless media such as acoustic, RF, infrared and other wireless media. The term computer readable media as used herein includes both storage media and communication media.

A carrier wave as well as a "modulated data signal" are not tangible and are also non-statutory. As such Claims 1-24 are rendered non-statutory.

Applicants have not explained how their amendments overcome the non-statutory nature of the claims due to the inclusion of a carrier wave in the specification of the instant application.

Appropriate correction is required.

All claims dependent upon a rejected base claim are rejected by virtue of their dependency.

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Art Unit: 2128

4. **Claims 1-12 are rejected** under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

i) Claim 1 recites **"a hint about a number of transactions..."** It is unclear what is meant by the term "hint" in this phrase and the scope, metes, and bounds of the term cannot be ascertained. Therefore the claims are rendered vague and indefinite. This applies to all other instances of the term.

ii) Claim 1 recites **"the number of requests that cannot be sent because the current number of outstanding transaction requests equals the maximum number of transactions available."** This phrase is confusing. If the number of transactions equals the maximum then wouldn't they still be sent since they do not exceed the maximum? This renders the claims vague and indefinite. This applies to all other instances of the term.

iii) Claim 8 recites **"equitable distribution."** It is unclear what is meant by the term "equitable" in this phrase and the scope, metes, and bounds of the term cannot be ascertained. Therefore the claims are rendered vague and indefinite. This applies to all other instances of the term.

iv) Claim 12 recites **"preferential weighting."** It is unclear what is meant by the term "preferential weighting" in this phrase and the scope, metes, and bounds of the term cannot be ascertained. Therefore the claims are rendered vague and indefinite. This applies to all other instances of the term.

Appropriate correction is required.

All claims dependent upon a rejected base claim are rejected by virtue of their dependency.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

Art Unit: 2128

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(c), (i) or (g) prior art under 35 U.S.C. 103(a).

5. **Claim(s) 1-3, and 5-24** are rejected under 35 U.S.C. 103(a) as being unpatentable over **Forecast et al.**, **“Dynamic Modeling for Resource Allocation in a File Server”**, U.S. Patent No. **6,230,200**, hereafter referred to as **Forecast**, in view of **Ballard “Client-Side Load-Balancing in Client Server Network”**, U.S. Patent No. **6,078,960**, hereafter referred to as **Ballard**.

Regarding Claim 1:

The references disclose A computer program product embodied on a computer-readable storage medium and comprising code that, when executed, causes a computing device to perform the following:

receiving from a client computing device at a server component on a server computing device information that indicates the client needs additional resources to perform a transaction, wherein the information received from the client includes a hint about a number of transactions that are currently pending on the client that exceed a maximum number of transactions available limit that was previously negotiated; (**Forecast. Column 3, Lines 14-20. “The allocation balancing routine... allocating or de-allocating an amount of resources...”. Column 13, Line 15- Column 14, Line 30, “scheduler” and “admission control policy”. Column 64, recited allocation code snippet**)

the server component being further configured to determine if allocating to the client the additional resources puts the server component in a resource constrained situation, and if so, to rebalance resources currently allocated to a plurality of existing clients; wherein each of the clients is a computing device that maintains information about the state of its allocated resources and pending transactions including a current number of

Art Unit: 2128

outstanding transaction requests; the maximum number of transactions available; and the number of requests that cannot be sent because the current number of outstanding transaction requests equals the maximum number of transactions available, wherein the maximum number of transactions available to each client is initially determined when each of the clients connects to the server at which point a negotiation is performed between the client and the server to establish the maximum number of transactions; wherein the maximum number of transactions specifies a number of transaction requests to be accepted by the server from the client; wherein when (EXAMINERS NOTE: **It appears that the word "when" is improperly used in this limitation.**) the resources are rebalanced by the server by issuing messages to any affected clients to either reduce or increase their maximum transaction available limit.

Forecast does not explicitly recite the client side load balancing aspect recited in the claim as wherein each of the clients maintains information about the state of its allocated resources and pending transactions including a current number of outstanding transaction requests and a maximum number of transactions available as well as manipulation of the maximum transaction available limit.

However Ballard discloses client side load balancing (Ballard. Abstract, "Load balancing is achieved at the client side.")

Ballard in Column 2, Lines 59-62 states "According to another aspect of the invention, an additional method for load balancing is achieved by specifying a maximum frequency of requests (e.g., xx requests/minute) at which a server can be accessed."

Forecast and Ballard are analogous art in the field of resource allocation.

It would have been obvious to one of ordinary skill in the art at the time of the invention to utilize the client side load balancing of **Ballard** with the load balancing of **Forecast** in order to produce an **"alternative, more reliable, more flexible technique for achieving load balancing of client demand."** (Ballard. Column 1, Lines 39-41)

The Examiner notes that the citations of Ballard and the motivation statement provided applies to all other instances of client side load balancing further recited in the claims. See Section 2.iii above.

Art Unit: 2128

Regarding Claim 2:

The references disclose The computer-readable medium of claim 1, wherein the server component executes on a server in a network environment. (**Forecast, Column 1, Line 67, “file server”**)

Regarding Claim 3:

The references disclose The computer-readable medium of claim 1, wherein the server component is further configured to allocate the client the additional resources needed if the server determines that such allocation does not create the resource constrained situation. (**Forecast, Column 17, Lines 1-10, “reasonable size for a disk read request”**)

Regarding Claim 5:

The references disclose The computer-readable medium of claim 1, wherein the server component determines if the resource constrained situation occurs by comparing a current number of resources allocated to the client with a total number of available resources. (**Column 3, Lines 14-20. “The allocation balancing routine... allocating or de-allocating an amount of resources...”**.)

Regarding Claim 6:

The references disclose The computer-readable medium of claim 5, wherein the determination further comprises comparing a current number of resources allocated to every client connected to the server component with the total number of available resources. (**Column 3, Lines 14-20. “The allocation balancing routine... allocating or de-allocating an amount of resources...”**.)

Regarding Claim 7:

The references disclose The computer-readable medium of claim 6, wherein the determination further comprises comparing the current number of resources allocated to every client connected to the server component and a number of requested resources with the total number of available resources. (**Column 3, Lines 14-20. “The**

allocation balancing routine... allocating or de-allocating an amount of resources...").

Regarding Claim 8:

The references disclose The computer-readable medium of claim 1, wherein the rebalance of the resources is performed based on an equitable distribution of the resources among the plurality of clients. **(Column 13, Line 15- Column 14, Line 30, “scheduler” and “admission control policy”).**

Regarding Claim 9:

The references disclose The computer-readable medium of claim 8, wherein the equitable distribution of the resources is based on a number of clients connected to the server component. **(Forecast. Column 8, Lines 63-65, “to prevent the video file server from performing conflicting operations in response to concurrent requests from various network clients.”)**

Regarding Claim 10:

The references disclose The computer-readable medium of claim 9, wherein at least one client connection has a preferential weighting with respect to other clients. **(Forecast. Column 12, Line 29-40, “a weight and a scheduling flag is assigned to every real-time task.”. Column 14, Lines 39, “weight assigned to real-time task”)**

Regarding Claim 11:

The references disclose The computer-readable medium of claim 8, wherein the equitable distribution of the resources is based on a number of open files associated with each client connected to the server component. **(Forecast. Column 8, Lines 63-65, “to prevent the video file server from performing conflicting operations in response to concurrent requests from various network clients.”)**

Regarding Claim 12:

Art Unit: 2128

The references disclose The computer-readable medium of claim 11, wherein at least one open file has a preferential weighting with respect to other open files. **(Forecast. Column 12, Line 29-40, "a weight and a scheduling flag is assigned to every real-time task". Column 14, Lines 39, "weight assigned to real-time task")**

Regarding Claim 13:

The references disclose A computer program product embodied on a computer-readable storage medium and comprising code that, when executed, causes a computing device to perform the following

a plurality of data stores, each data store being associated with a different client connection to a server computing device, each data store including: **(Forecast. Column 1, Line 67, file server)**

a credits used field that identifies a number of resource credits currently in use by a client computing device corresponding to the data store; **(Forecast. Column 2, Lines 52-65, resource allocation.)**

a credit limit field that identifies a number of resources available to the client corresponding to the data store; **(Forecast. Column 2, Lines 52-65, resource allocation.)**

a pending count field that identifies a number of transactions that are pending due to an unavailability of sufficient resources to handle the transactions; and **(Forecast. Column 3, Lines 14-20, "imbalance condition")**

an open files field that identifies a number of files that are currently in use by the client; **(Forecast. Column 63, Lines 15-20. Opening files and allocation of needed resources)**

receiving a transaction request message on the server computing device from the client; wherein the transaction request message received from the client includes the number of transactions that are pending due to an unavailability of sufficient resources to handle the transactions that was previously negotiated; wherein the number of resources available to the client that are stored in the credit limit field is a maximum number of transactions available to the client that is initially determined when the client connects to the server at which point a negotiation is performed between the client and the server to establish the maximum number of transactions; and wherein the server rebalances resources when the transaction request places the server in a resource constrained situation; wherein when the resources are rebalanced, the server issues messages to any affected clients to either reduce or increase their maximum number of transactions that are available.

Forecast does not explicitly recite the client side load balancing aspect recited in the claim as wherein the server receives a transaction request message from the client; and wherein the server rebalances resource when the transaction request places the server in a resource constrained situation.

However Ballard discloses client side load balancing (Ballard. Abstract, “Load balancing is achieved at the client side.”)

Ballard in Column 2, Lines 59-62 states “According to another aspect of the invention, an additional method for load balancing is achieved by specifying a maximum frequency of requests (e.g., xx requests/minute) at which a server can be accessed.”

Forecast and Ballard are analogous art in the field of resource allocation.

It would have been obvious to one of ordinary skill in the art at the time of the invention to utilize the client side load balancing of Ballard with the load balancing of Forecast in order to produce an “alternative, more reliable, more flexible technique for achieving load balancing of client demand.” (Ballard. Column 1, Lines 39-41)

The Examiner notes that the citations of Ballard and the motivation statement provided applies to all other instances of client side load balancing further recited in the claims. See Section 2.iii above.

Regarding Claim 14:

The references disclose The computer-readable medium of claim 13, wherein the data store further comprises a flag field that identifies whether the corresponding client has acknowledged a resource-related message. (Forecast. Column 12, Line 29-40, “a scheduling flag is assigned to every real-time task.”)

Regarding Claim 15:

The references disclose The computer-readable medium of claim 13, wherein a value of the pending count field is provided by the client in connection with a transaction request message. (Forecast. Column 2, Lines 52-65, data stream access and allocation with balancing of resources)

Art Unit: 2128

Regarding Claim 16:

The references disclose The computer-readable medium of claim 15, wherein a value of the credit limit field is modified based on the value of the pending count field. **(Forecast. Column 2, Lines 52-65, data stream access and allocation with balancing of resources)**

Regarding Claim 17:

The references disclose The computer-readable medium of claim 13, wherein values for the credit limit fields of the plurality of data stores is rebalanced based on an equitable distribution of available resources. **(Forecast. Column 8, Lines 63-65, "to prevent the video file server from performing conflicting operations in response to concurrent requests from various network clients.")**

Regarding Claim 18:

The references disclose

A computer program product embodied on a computer-readable storage medium and comprising code that, when executed, causes a computing device to perform the following a server component configured to: receive information from a client that indicates the client needs additional resources to perform a transaction; wherein the information received from the client includes a number of transactions that are that are pending due to an unavailability of sufficient resources to handle; wherein the number of transactions was previously negotiated; and to rebalance resources currently allocated to the client; wherein when server issues messages to any affected clients when the resources are rebalanced by the server; wherein the messages indicate to either reduce or increase each of the affected clients number of resources, wherein the client maintains information about the state of its allocated resources and pending transactions within a data structure, comprising:

a credits used field that identifies a number of resource credits currently in use by a client corresponding to the data structure;

Art Unit: 2128

a credit limit field that identifies a number or resources available to the client; wherein the number of resources available to the client is initially determined when the client connects to the server at which point a negotiation is performed between the client and the server to establish the number of resources;

a pending count field that identifies the number of transactions that are pending due to an unavailability of sufficient resources to handle the transactions; and

a pending queue field that includes transaction messages corresponding to the transactions that are pending.

See rejection for claims 13-17. Pending transactions can be seen in Column 12, Lines 29-40 with respect to "scheduling flag" and "pending work."

Regarding Claim 19:

The references disclose A computer-implemented method embodied on a computer-readable storage medium, that when executed, causes a computing device to perform the following: computing a total number of client connections, each client connection being associated with a client connected to a server, each client having a credit limit that identifies a number of resources that are allocated to the client; wherein the number of resources that are available to client is initially determined when the client connects to the server at which point a negotiation is performed between the client and the server to the number of resources; wherein the client maintains information about the state of its allocated resources including a current number of outstanding credits used and a maximum number of credits available; computing a total number of pending requests on each client device that identifies a number of transaction requests that are not being handled due to a limitation on resources; computing a total number of credits in use; and if the total number of pending requests and the total number of credits in use combined exceeds a total number of available resources, calculating on the server a new credit limit for each of the clients connected to the server; and reallocating the total available resources in accordance with the new credit limits; and issuing messages to affected clients indicating to either reduce or increase their negotiated number of resources.

See rejection for claims 13-17. Reallocating resources with new limits is seen in Column 57, Lines 5-15 with basing scheduling on actual level of resources available.

Art Unit: 2128

Regarding Claim 20:

The references disclose The computer-implemented method of claim 19, wherein the reallocation is based on each client connection receiving a pro rata share of the total available resources. (**Forecast, Column 12, Lines 57-Column 13, Line 6, "priority." Column 15-16 discuss constraint conditions and priority which reads on "pro rata".**)

Regarding Claim 21:

The references disclose The computer-implemented method of claim 20, wherein the pro rata share of the total available resources is based on the total available resources divided among the total number of client connections. (**Forecast, Column 12, Lines 57-Column 13, Line 6, "priority." Column 15-16 discuss constraint conditions and priority which reads on "pro rata".**)

Regarding Claim 22:

Forecast does not explicitly recite The computer-implemented method of claim 21, wherein the total available resources are divided evenly among the total number of client connections.

However Ballard discloses even distribution. (Ballard, Column 5, lines 36-38, "equal division". Figure 4A)

Forecast and Ballard are analogous art in the field of resource allocation.

It would have been obvious to one of ordinary skill in the art at the time of the invention to utilize the even load balancing of **Ballard** with the load balancing of **Forecast** in order to produce an **"alternative, more reliable, more flexible technique for achieving load balancing of client demand."** (**Ballard, Column 1, Lines 39-41**)

The Examiner notes that the citations of Ballard and the motivation statement provided applies to all other instances of client side load balancing further recited in the claims.

Regarding Claim 23:

Art Unit: 2128

The references disclose The computer-implemented method of claim 21, wherein at least one of the client connections is weighted more heavily than another of the client connections. **(Forecast. Column 12, Lines 3-11, weighted scheme. Column 12, Line 29-40, “a weight and a scheduling flag is assigned to every real-time task.”. Column 14, Lines 39, “weight assigned to real-time task”)**

Regarding Claim 24:

The references disclose The computer-implemented method of claim 20, wherein the pro rata share for a particular client is based on a proportion of a total number of open files to a number of open files for the particular client. **(Forecast. Column 63, Lines 15-20. Opening files and allocation of needed resources)**

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(c), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 2128

6. **Claim(s) 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over Forecast in view of Ballard further in view of in view of Haugseth et al. "Computer Network Controller", U.S. Patent No. 6,856,619, hereafter referred to as Haugseth.**

Regarding Claim 4:

Forecast in view of Ballard does not explicitly disclose The computer-readable medium of claim 1, wherein the clients and the server component communicate using a light weight input/output protocol.

The light weight input/output protocol is defined in the specification in paragraph 21 as:

[0021] Each client has a connection (e.g., connections 204, 206, 208, respectively) to the server 201. The clients and the server 201 may communicate using one of many different communication protocols. One communication protocol that may be used for distributed file systems is the Light Weight I/O (LWIO) protocol. The LWIO protocol enables an application operating on one computer (i.e., the client 203) to communicate directly with a file system on the server 201 without necessarily involving kernel-mode resources on the client computer. Bypassing kernel-mode operations reduces the overhead associated with distributed file access, resulting in improved performance over other protocols, like TCP/IP. Clients can, however, have both user and kernel level components performing file I/O transactions on the server 201.

The **Forecast** reference discusses in Column 10, Lines 9-19 utilizing various communication protocols but does not explicitly refer to a LWIO protocol.

However, the **Haugseth** reference discloses SAN/RDMA, which as per the definition of LWIO protocol in the specification, utilize bypass of kernel mode resources and allow for direct access. (**Haugseth**. See **Claim 1 as well as Column 2, Lines 35-60**)

It would have been obvious to one of ordinary skill in the art at the time of the invention to utilize a LWIO protocol as defined in the specification and referred to in **Haugseth** as SAN/RDMA in order to allow for increased performance and reducing time for the resource allocation discussed in **Forecast in view of Ballard**. (**Haugseth**. **Column 1, Lines 40-50**) (**Forecast**. **Column 1, Lines 15-20**. **Performance Guarantees**)

Art Unit: 2128

Conclusion

7. All Claims are rejected.
8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to SAIF A. ALHIJA whose telephone number is (571)272-8635. The examiner can normally be reached on M-F, 11:00-7:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kamini Shah can be reached on (571) 272-22792279. The fax phone number for the organization where this application or proceeding is assigned is (571) 273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
